

THE SYNAPRIX AI TOOL STACK

Step-by-Step Setup Guide with Real Configurations

This is the exact tech stack we use with clients. Everything here works, costs under RM500/month total, and can be deployed in 3-5 days.

THE COMPLETE STACK

Tool	Purpose	Cost	Setup Time
Vapi.ai	Voice AI receptionist	\$99-299/month	2-3 hours
Make.com	Automation glue	\$9-29/month	1-2 hours
Google Calendar	Booking system	Free	30 mins
Twilio	SMS confirmations	~\$20/month	30 mins
Airtable/HubSpot	CRM	Free-\$50/month	1 hour
Slack	Team notifications	Free	15 mins

Total: ~RM300-500/month for a complete AI front desk

TOOL 1: VAPI.AI (AI VOICE RECEPTIONIST)

What it does: Answers phone calls 24/7, sounds human, books appointments

Setup Process:

Step 1: Create Account

1. Go to vapi.ai
2. Sign up (they give \$10 free credit to test)
3. Go to Dashboard → Assistants → Create New Assistant

Step 2: Configure Your Assistant

Basic Settings:

Name: [Your Business] Receptionist
Voice: "Jenny" (US English, friendly) or "Nova" (younger, energetic)
Model: GPT-4 (more natural) or GPT-3.5-turbo (cheaper)
Temperature: 0.7 (balanced between creative and consistent)

System Prompt:

[Copy the AI Receptionist prompt from the Prompt Templates document]

First Message (greeting):

Hi, thanks for calling [BUSINESS NAME]! This is [AI NAME]. How can I help you today?

Step 3: Function Calling (for booking)

Vapi lets you call external APIs mid-conversation. Set this up for checking calendar availability:

Function: check_availability

```
{
  "name": "check_availability",
  "description": "Check if a time slot is available for booking",
  "parameters": {
    "type": "object",
    "properties": {
      "date": {
        "type": "string",
        "description": "Date in YYYY-MM-DD format"
      },
      "time": {
        "type": "string",
        "description": "Time in HH:MM format (24-hour)"
      },
      "service": {
        "type": "string",
        "description": "Type of service being booked"
      }
    }
  },
  "required": ["date", "time"]
}
```

Function: create_booking

```
{
  "name": "create_booking",
  "description": "Create a new appointment booking",
  "parameters": {
    "type": "object",
    "properties": {
      "customer_name": {"type": "string"},
      "phone": {"type": "string"},
      "email": {"type": "string"},
      "date": {"type": "string"},
      "time": {"type": "string"},
      "service": {"type": "string"},
      "notes": {"type": "string"}
    }
  },
  "required": ["customer_name", "phone", "date", "time", "service"]
}
```

Step 4: Get Your Phone Number

Vapi provides a phone number, or bring your own:

Vapi number:: \$1/month, instant setup

Your existing number:: Forward calls to Vapi number (carrier dependent)

Call Forwarding Setup:

After hours only:: Forward from 6 PM - 9 AM + weekends

Overflow:: Forward when lines are busy (4+ rings)

Full replacement:: Forward all calls (test thoroughly first!)

Step 5: Testing Checklist

Call your Vapi number and test these scenarios:

- General question (business hours, location)
- Booking request (should check calendar, confirm slot)
- Urgent issue (should offer to transfer or take callback number)
- Price question (should answer or route to human)
- Random small talk (should politely redirect to purpose of call)

Common Issues & Fixes:

Issue: AI talks too long

Fix: Add to prompt: "Keep responses under 2 sentences. Speak in 10-15 word chunks."

Issue: AI sounds robotic

Fix: Change voice to "Jenny" or "Nova", increase temperature to 0.8

Issue: AI doesn't understand accents

Fix: Add example phrases to prompt: "Customer might say 'appointment' as 'appoint-ment' or 'booking' - these mean the same thing"

TOOL 2: MAKE.COM (AUTOMATION HUB)

What it does: Connects Vapi → Calendar → CRM → Slack → SMS

Setup Process:

Step 1: Create Account

1. Go to make.com
2. Sign up (free plan: 1,000 operations/month - enough to start)
3. Create a new Scenario

Step 2: Scenario 1 - New Booking Flow

Trigger: Webhook (Vapi calls this when booking confirmed)

Modules in sequence:

1. **Webhook** (receives data from Vapi)

```
{
  "customer_name": "John Doe",
  "phone": "+60123456789",
  "email": "john@example.com",
  "date": "2026-06-15",
```

```
"time": "14:00",
"service": "Consultation"
}
```

2. Google Calendar: Create Event

- Summary: [Service] - [Customer Name]
- Start: [Date] [Time]
- Duration: 60 minutes (or your default)
- Description: Include phone, email, notes

3. Twilio: Send SMS (to customer)

Hi [Name]! You're booked at [Business] for [Service] on [Date] at [Time].
Reply CANCEL to cancel. See you soon!

4. Slack: Send Message (to team channel)

■ New booking!

```
Customer: [Name]
Service: [Service]
When: [Date] at [Time]
Phone: [Phone]
```

Added to calendar ✓

5. Airtable/HubSpot: Create Contact (add to CRM)

- Name: [Customer Name]
- Phone: [Phone]
- Email: [Email]
- Tag: "AI_BOOKED"
- Source: "AI Receptionist"

To connect Vapi to Make:

1. In Vapi dashboard → Settings → Webhooks
2. Add Make.com webhook URL
3. Select trigger: "booking_completed"
4. Test by making a test booking call

Step 3: Scenario 2 - Lead Scoring Flow

Trigger: Webhook (from WhatsApp chat, website form, etc.)

Modules:

1. **Webhook** (receives lead data)
2. **OpenAI: Create Completion** (score the lead)

Analyze this lead and score them as HOT/WARM/COLD based on:

- Problem urgency
- Budget fit
- Timeline

```
Lead info: [paste webhook data]
```

Output JSON: {"score": "HOT", "reason": "..."}

3. Router (split based on score)

- Route 1: HOT → Slack alert + immediate callback
- Route 2: WARM → Email sequence + CRM tag
- Route 3: COLD → Newsletter + long nurture

4. CRM Update (tag lead with score)

Common Make.com Mistakes to Avoid:

- **Don't:** Chain 20+ modules in one scenario (slows down, hard to debug)
 - **Do:** Break into multiple scenarios, trigger via webhooks
 - **Don't:** Run on every single event (wastes operations)
 - **Do:** Batch process or add filters ("only if status = confirmed")
 - **Don't:** Hardcode values
 - **Do:** Use variables and error handlers
-

TOOL 3: GOOGLE CALENDAR (BOOKING SYSTEM)

What it does: Stores all appointments, syncs with team calendars

Setup:

1. Create a dedicated booking calendar (don't use personal)
2. Set working hours (Calendar Settings → Working Hours)
3. Add buffer times between appointments:
 - Settings → Event Settings → Default Event Duration: 60 mins
 - Add 15-min buffer by ending events at :45 instead of :00

Integration with Vapi:

1. Get Calendar API credentials (Google Cloud Console)
2. In Make.com, connect Google Calendar module
3. Vapi → Make → Calendar (creates event)

Pro tip: Create different calendars for different services

- calendar-consultations@yourbusiness.com
 - calendar-treatments@yourbusiness.com
 - Route bookings to the right calendar based on service type
-

TOOL 4: TWILIO (SMS CONFIRMATIONS)

What it does: Sends booking confirmations, reminders, cancellation handling

Setup:

1. Sign up at [twilio.com](https://www.twilio.com)
2. Get a phone number (\$1/month)
3. Copy Account SID and Auth Token

4. In Make.com:

- Add Twilio module
- Connect with SID + Token
- Send SMS on booking confirmation

SMS Templates:

Booking Confirmation:

Hi [Name]! You're booked at [Business] for [Service] on [Date] at [Time].

Reply CANCEL to cancel.

See you soon!

- Team [Business]

24-Hour Reminder:

Reminder: You have an appointment tomorrow at [Time] for [Service].

Reply CONFIRM or CANCEL.

[Business Address]

Cancellation Received:

Your [Date] appointment has been cancelled.

To rebook, call [Phone] or visit [Website].

Pro setup: Handle SMS replies in Make.com

- Webhook from Twilio (incoming SMS)
- If message contains "CANCEL" → delete calendar event, notify team
- If message contains "CONFIRM" → add confirmed tag to booking

TOOL 5: AIRTABLE (CRM)

What it does: Stores all customer data, tracks lead pipeline

Setup:

Base Structure:

Table: Customers

Field	Type	Purpose
Name	Single line text	Full name
Phone	Phone number	Contact
Email	Email	Contact
Source	Single select	AI_Receptionist, Website, Referral

Field	Type	Purpose
Lead Score	Single select	HOT, WARM, COLD
Status	Single select	New, Contacted, Booked, Closed, Lost
First Contact	Date	When they first reached out
Notes	Long text	All conversation history
Lifetime Value	Currency	Total spent

Table: Bookings

Field	Type	Purpose
Customer	Link to Customers	Who booked
Service	Single select	What they booked
Date	Date	Appointment date
Time	Single line text	Appointment time
Status	Single select	Confirmed, Completed, Cancelled, No-show
Booking Source	Single select	AI, Manual, Website

Automations in Airtable:

- When Status = "Booked" → Send to "Upcoming" view
- When Date is today → Move to "Today's Appointments" view
- When Status = "Completed" → Calculate LTV

Connect to Make.com:

1. Make.com → Airtable module
2. On booking → Create record in Bookings table
3. On new lead → Create record in Customers table

TOOL 6: SLACK (TEAM NOTIFICATIONS)

What it does: Instant alerts when hot leads come in or bookings happen

Setup:

1. Create channels:
 - **#ai-bookings** - all confirmed appointments
 - **#hot-leads** - urgent leads needing immediate callback
 - **#ai-logs** - full conversation logs (optional)
2. Create Slack webhook:
 - Slack → Apps → Incoming Webhooks
 - Add to channel
 - Copy webhook URL
3. In Make.com:

- Add HTTP module
- POST to webhook URL
- Send formatted message

Message Format for Hot Leads:

```
{
  "text": "■ HOT LEAD - CALL NOW",
  "blocks": [
    {
      "type": "section",
      "text": {
        "type": "mrkdwn",
        "text": "*New Hot Lead* ■\n\n*Name:* John Doe\n*Phone:* +60123456789\n*Problem:* Urgent issue with X\n"
      }
    },
    {
      "type": "actions",
      "elements": [
        {
          "type": "button",
          "text": {"type": "plain_text", "text": "Call Now"},
          "url": "tel:+60123456789",
          "style": "danger"
        }
      ]
    }
  ]
}
```

DEPLOYMENT ROADMAP

Week 1: Core Setup

- Day 1: Set up Vapi, test voice calling
- Day 2: Configure prompts, add FAQs
- Day 3: Connect Google Calendar
- Day 4: Set up Make.com booking flow
- Day 5: Add Twilio SMS confirmations
- Day 6-7: Test everything with team, fix issues

Week 2: Go Live

- Day 1: Forward after-hours calls only (6 PM - 9 AM)
- Day 2-3: Monitor all calls, tune prompts
- Day 4: Add CRM integration (Airtable)
- Day 5: Set up Slack notifications
- Day 6-7: Analyze first week data, optimize

Week 3: Scale

- Add lead qualifier (WhatsApp or web chat)
- Connect lead scoring to CRM
- Build email nurture sequences
- Set up analytics dashboard

TROUBLESHOOTING GUIDE

"AI isn't booking appointments correctly"

→ Check Make.com logs. Usually calendar permissions or wrong date format.

"Customers complaining AI sounds robotic"

→ Switch to "Jenny" or "Nova" voice, add more conversational fillers to prompt.

"Too many bad leads getting through"

→ Tighten qualifier questions, add explicit budget check earlier.

"Team not getting notifications"

→ Check Slack webhook URL, test with manual trigger in Make.com.

"Calendar double-bookings"

→ Add buffer times, check timezone settings, verify availability check works.

COST BREAKDOWN (MONTHLY)

Item	Cost
Vapi.ai (1000 mins/month)	\$99-149 USD (~RM400-650)
Make.com (Basic plan)	\$9 USD (~RM40)
Twilio (500 SMS)	\$20 USD (~RM85)
Google Calendar	Free
Airtable (Plus plan)	\$20 USD (~RM85)
Slack	Free
TOTAL	**~RM600-860/month**

Compare to hiring a full-time receptionist: RM3,000-5,000/month

ROI: Pays for itself if you capture just 2-3 extra bookings per month.

NEED HELP SETTING THIS UP?

We do this for clients all the time. If you want us to set up your entire AI stack:

DM "SETUP" on Instagram @synaprix

We'll jump on a free 30-min call and walk you through it step-by-step.

Or book it as a done-for-you service (we handle everything, you just approve the prompts).
